Please find attached requested plans for the above project. The plans are 20 scale reflecting one foot contours for the site along with house and septic systems and proposed final grading. The driveway profile remains the same as shown on the prior submitted plans. Drainage has been slightly revised in that we are no longer proposing pervious pavement but are substituting standard paving. Drainage will be controlled by stone filled trenches on each side of the driveway and stone underlying the driveway. As noted before, the underlying soil perc's at less than 2m/l and will accept readily typical storm runoff. We have also shown an additional runoff/recharge area at the common drive terminus which is also located at the low point of the driveway.
